

LAS OLAS BOULEVARD MOBILITY PROJECT WESTERN CORRIDOR

 **Location:** FAU MetroLab, 111 E Las Olas Blvd

 **Date:** November 13, 2025

 **Time:** 6:00 PM to 7:30 PM

Public Town Hall Summary

Agenda

1. Preliminary Design 6:00 PM
2. Question & Answers at Stations 6:30 PM
3. Wrap-up 7:30 PM

Overview

The City of Fort Lauderdale and its consultant team hosted a public town hall on November 13, 2025, at 6:00 PM to share preliminary design concepts for the Western Section of the Las Olas Boulevard Mobility Project and gather community input.

The presentation provided an overview of project history, cross-section alternatives, proposed streetscape improvements, stormwater modeling, and construction cost estimates across the Downtown, Shops, and Colee Hammock segments.

Following the presentation, attendees participated in three breakout stations—Safety & Mobility, Livability & Landscape, and General Questions—where the consultant team answered questions and collected written and verbal feedback.

Attendees

A total of 53 individuals signed in, and 25–30 written comment cards were collected. Some participants joined later, and their information was not collected.

Attendees included residents from Downtown, Colee Hammock, Beverly Heights, the Isles, South Middle River, and Las Olas-area condominiums; business owners and property managers from the Shops section; representatives from local civic and neighborhood associations; members of advocacy groups such as Better Streets Broward; and additional stakeholders from nearby districts.

City staff, WSP's design team: Marlin Engineering, Local Office, and Brizaga were present to support the meeting and answer questions.

Station 1 – Safety & Mobility

Participants expressed interest in creating a safer, more predictable multimodal corridor- the importance of comfortable, well-lit sidewalks, particularly for visitors in the Shops section.

Metered on-street parking: Many residents supported removing on-street parking in the Shops section to provide wider sidewalks, improve visibility, and make space for shade and pedestrian activity. Others raised concerns about whether removing travel lanes for permanent parking could affect traffic flow or emergency response. The consultant team explained that SE 15th Ave via Broward Blvd is the primary evacuation route from the Isles and the same route used by the city's emergency services. Also, sidewalk expansion is limited without removing on-street parking.

Bicycle facilities: A participant requested dedicated, protected bicycle facilities and clearer signage at transition points. A few participants preferred bicycle lanes located behind parking, where feasible. Residents requested clearer signage to indicate where various pedestrian and bicycle facilities begin and end. Also, they expressed interest in exploring a shared-use crossing near the SE 17th Avenue bridge.

- A participant suggested considering a scramble crosswalk at SE 3rd Avenue.
- Another participant noted the difficulty in exiting SE 5th Ave onto Las Olas Boulevard and the challenges with valet parking at the Lobster Bar.
- Other discussion topics included cut-through traffic on neighborhood streets, anticipated circulation changes, and ensuring updated signals support safe and efficient operations.

Station 2 – Livability & Landscape

Participants focused on shade, comfort, and maintaining Las Olas Boulevard's long-term identity.

Proposed trees: Support for a diverse mix of native, salt-tolerant, and climate-resilient species, and interest in avoiding species with limited canopy potential. Residents emphasized maintaining a cohesive, recognizable canopy character through appropriate species selection and discussed the arborist's assessment of the existing Black Olives.

Shade along sidewalks and nighttime lighting: Residents supported increasing shade along sidewalks and outdoor dining areas and emphasized interest in mature tree plantings to provide meaningful canopy at installation. Many participants supported shaded public seating and discussed balancing programming with enforcement considerations. They noted the need to improve nighttime ambiance and enhance the pedestrian experience year-round. Stakeholders noted they would like to retain specialty lighting, including up-lighting and seasonal or decorative lighting elements.

Mature trees during installation: Several attendees expressed interest in using larger, more mature trees to ensure early canopy establishment. Also, some noted tree bump-outs or 5-ft islands in constrained areas would allow larger canopy growth. Attendees noted the complexity of removing existing trees given deep root systems, utility conflicts, and groundwater conditions.

Public Realm, Seating & Experience: Participants expressed a strong desire for more shaded public seating. Emphasis on preserving the experiential quality of Las Olas as a pedestrian-friendly, culturally active corridor (festivals, closures, street life). Interest was expressed in public art, sculptures, and enhanced public realm features, with questions about placement and funding. There was also interest in improving wayfinding along the corridor.

Station 3 – General Questions

Funding capital investment and long-term maintenance: Attendees asked about construction phasing, estimated costs, funding sources, and the duration of potential disruptions. Also, there was a discussion on long-term funding and maintenance responsibilities.

Construction phasing: Business owners expressed interest in understanding construction timelines and access management. Requests were made for preliminary phasing concepts and for clarification on whether construction would occur block by block or continuously. Attendees emphasized maintaining business access and traffic flow during construction. Some attendees referenced experiences from Miracle Mile and asked about best practices for minimizing construction impacts. Participants emphasized the importance of coordinating all underground work, including stormwater, water, and utilities, to avoid multiple rounds of construction. Questions were raised about the potential for additional underground work costs based on site conditions.

Existing black olive trees: The arborist shared reasons why the existing Black Olive trees are not part of the proposed landscape plan and cannot be relocated. The existing trees are at the end of their life. The typical lifetime of urban trees is about 30 years. The Black Olive trees are older, and some show defects: codominant leaders with included bark, trunk damage, evidence of wood-decay organisms, cavities, and small-diameter dead wood. In addition, the existing trees were planted in elevated planter boxes to create a bonsai effect by limiting the available space. The planter boxes have developed a large root mass, with minimal structural roots extending beyond the boxes. The planter boxes and the resulting root plate mass could potentially act as a pivot point. Also, relocating these is not recommended due to their confined root systems. At the new site, the trees would lack the root network required to establish stability.

Residents noted that certain wildlife, such as parrots, utilize the existing Black Olive trees. The arborist said that the expectation was that the birds would reestablish on the new proposed trees.

Other questions participants raised included how the redesign would affect stormwater performance at SE 15th Avenue.
